Risk Management Study

Actually there is no any risk for this project because the project is a customer - oriented on demand project and that's why there is no any risk for marketing.

Risks are as general:

    i.   Risk of never getting results.
   ii.   risk of delay.
  iii.   Risk of going over budget.
  iv.   Risk of deficiencies in the final product.
   v.   Risk of difficulty in operating the project product.
  vi.   The risk that the project product will not perform as expected.
 vii.   Impossible to update or modernize the project product in the future risk of being.

And according to above, maybe they can be as risks ii., iii., iv., and vi. because of coding about my project. İf I will have kinds of these problems, it will be enough that I just control my rows of code to fix the problem which can be, for now.

That's why actually my project has little risks. But for only risk of iii., be very careful while doing this, in the future. Because if there even very small fault about hardware, it affect all project.
